

Q1.2.

We can still use the similar idea to sort this array using $n \log n$ time. I'll still have a sample code to show how I sort this array using $n \log n$ time.

```
1 class MergeSort {
2     void merge(int arr[], int l, int m, int r) {
3         int n1 = m - l + 1;
4         int n2 = r - m;
5         int l[] = new int[n1];
6         int r[] = new int[n2];
7         for (int i = 0; i < n1; ++i)
8             l[i] = arr[l + i];
9         for (int j = 0; j < n2; ++j)
10            r[j] = arr[m + 1 + j];
11        int i = 0, j = 0;
12        int k = l;
13        while (i < n1 && j < n2) {
14            if (l[i] <= r[j]) {
15                arr[k] = l[i];
16                i++;
17            }
18            else {
19                arr[k] = r[j];
20                j++;
21            }
22            k++;
23        }
24        while (i < n1) {
25            arr[k] = l[i];
26            i++;
27            k++;
28        }
29        while (j < n2) {
30            arr[k] = r[j];
31            j++;
32            k++;
33        }
34    }
```

```
35 ▼ void sort(int arr[], int l, int r) {
36 ▼     if (l < r) {
37         int m = l + (r - l) / 2;
38         sort(arr, l, m);
39         sort(arr, m + 1, r);
40         merge(arr, l, m, r); // merge the sorted
41     }
42 }
```
